Description**Technical Field**

5 [0001] The present invention relates to novel 2-iminopyrrolidine derivatives, salts thereof, and pharmaceutical compositions containing the same and the like.

Background Art

10 [0002] A recent approach for thrombosis have involved inhibiting thrombin enzyme activity, and compounds used for this purpose have included heparin, low molecular weight heparin, hirudin, argatroban, hirulog and the like. All such compounds inhibit the enzyme activity of thrombin, and work by inhibiting fibrin blood clot formation without specifically inhibiting the effect of thrombin on cells. Bleeding tendency is therefore a common side effect encountered in the clinic. The role of thrombin in thrombosis is not limited to its blood clotting activity, as it is believed to also participate in platelet aggregation at sites of vascular injury occurring as a result of the activation of platelet thrombin receptor.

15 [0003] Another approach for thrombosis has been the use of intravenous injection agents such as Abciximab, Eptifibatide and Tirofiban, as GPIIb/IIIa receptor antagonists. These compounds, while exhibiting powerful anti-thrombotic effects by suppressing platelet aggregation induced by various stimulation such as thrombin, ADP, collagen, PAF or the like, also produce a bleeding tendency as a side effect similarly to thrombin enzyme activity inhibitors. For this reason, no such compounds have yet been marketed, although their development as oral agents continues to progress.

20 [0004] Restenosis is a vascular hypertrophic response to vascular wall injury induced by invasive treatment such as coronary angioplasty, and this phenomenon may be provoked by the direct or indirect effect of thrombin on cells. Platelets adhere to injured blood vessels, leading to release of growth factors and eliciting proliferation of smooth muscle cells. Smooth muscle cells may also be affected indirectly by the action of thrombin on endothelial cells. Also, platelet adhesion occurs and procoagulant activity increases at sites of vascular injury. Smooth muscle cells can undergo further direct stimulation due to the high local thrombin concentration which is produced at such sites. While recent studies using the powerful thrombin inhibitor hirudin have suggested that thrombin induces cell proliferation during the process of restenosis, it has not yet been determined whether the thrombin effect is direct or indirect (Sarembock et al., Circulation 1992, 84:232-243). Despite the implication of the cellular effects of thrombin in a variety of pathological symptoms, no therapeutically active substance is known which specifically blocks such effects.

30 [0005] The thrombin receptor (PAR1) has recently been cloned (Vu et al., Cell, 1991, 64:1057-1068), opening an important door to development of substances which target cellular thrombin receptors. Detailed examination of the amino acid sequence of this thrombin receptor has revealed a thrombin binding site and hydrolysis site located in the 100 residue amino terminal domain of the receptor. Later research by amino acid mutation in the receptor has established that limited hydrolysis of this portion of the thrombin receptor by thrombin is necessary for receptor activation (Vu et al., Nature, 1991, 353:674-677). A synthetic peptide corresponding to the amino acid sequence newly generated by hydrolysis of the thrombin receptor (the synthetic peptide is known as "thrombin receptor activating peptide", or TRAP) can activate receptors which have not been hydrolyzed by thrombin. This suggests that upon the cleavage of the receptor, the new amino acid sequence generated at the amino terminal (known as the "tethered ligand peptide") functions as the ligand and interacts with the distal binding site. Further studies of TRAP have confirmed homology of the thrombin receptors present in platelet, endothelial cell, fibroblast and smooth muscle cell (Hung et al., J. Cell. Biol. 1992, 116:827-832, Ngaiza, Jaffe, Biochem. Biophys. Res. Commun. 1991, 179:1656-1661).

45 [0006] Research on the structure activity relationship of TRAP suggests that the pentapeptide Phe-Leu-Leu-Arg-Asn is a weak antagonist for platelet thrombin receptors activated by either thrombin or TRAP (Vassallo, et al., J. Biol. Chem., 1992, 267:6081-6085(1992)). Different approaches to receptor antagonism have also been examined by other groups. One of these approaches has been an attempt to prepare antibodies for the thrombin binding domain of the thrombin receptor. Such antibodies specifically and effectively suppress activation of platelets by thrombin, and act as thrombin receptor antagonists (Hung et al., J. Clin. Invest. 1992, 89:1350-1353). Another approach has been development of peptide derivatives from TRAP (Steven M.S., J. Med. Chem. 1996, 39:4879-4887; William J.H., Bioorg. Med. Chem. Lett. 1998, 8:1649-1654; David F.M., Bioorg. Med. Chem. Lett. 1999, 9:255-260). Yet another has been development of low molecular weight compounds discovered by high throughput screening using various assay systems such as receptor binding (Andrew W.S. et al., Bioorg. Med. Chem. Lett. 1999, 9:2073-2078; Scherig Plough WO99/26943; Halord S. et al., ACS meeting in Oct. 2001).

Disclosure of the Invention

[0007] Compounds having antagonistic action on thrombin receptors are expected to exhibit excellent effects for therapy or prevention of diseases associated with thrombin, and therefore offer promise for effective therapy or pre-

vention of, for example, thrombosis, vascular restenosis, deep venous thrombosis, pulmonary embolism, cerebral infarction, heart disease, disseminated intravascular coagulation, hypertension, inflammatory diseases, rheumatism, asthma, glomerulonephritis, osteoporosis, neurological disorders, malignant tumors, and the like. It has been ardently desired to provide thrombin receptor antagonists which are satisfactory in numerous aspects including pharmacological activity, thrombin receptor specificity, safety, dosage and oral efficacy.

[0008] However, the conventional thrombin receptor antagonists have been inadequate in terms of receptor specificity and oral efficacy.

[0009] It is therefore an object of the present invention to search for and discover compounds having excellent thrombin receptor inhibiting activity and being therefore useful as thrombin receptor antagonists.

[0010] As a result of much vigorous research conducted under the circumstances described above, the present inventors have completed this invention upon successfully synthesizing novel 2-iminopyrrolidine derivatives represented by the following general formula (I), and also upon unexpectedly finding that these compounds or their salts have excellent thrombin receptor inhibiting activity and are useful as thrombin receptor antagonists.

[0047] Production processes for compounds of the invention and salts thereof will now be described. Various processes are possible for production of the compounds of the invention represented by the general formula (I) above and their salts, and the synthesis may be carried out by ordinary organic synthesis methods. The following representative production processes will now be presented.

[Representative production processes]

[0048] Compounds represented by the general formulas (A1-c) and (A1-c'), which are aromatic or heteroaromatic ring-fused cyclic amidines, may be synthesized from (A1-a) and (A1-b) by the methods described later.

<Production Process A>

[0049] A process of synthesizing the aromatic or heteroaromatic ring-fused cyclic amidine compounds (A1-c) and (A1-c'), and compound (A3-b), imino-protected compound (A1-c).

(Scheme A-1)

[0050] This scheme is a method of synthesizing (A1-c) from (A1-a) and (A1-b) by the methods described later.

[0051] In the formulas, Ar and Ar' have the same definition as Ar in the compounds represented by formula (I) in claim 1. R1, R2, R3, R4 and R5, and R1', R2', R3', R4' and R5' are defined in Production Process B onward.

[0052] Step 1 is a coupling reaction between compounds (A1-a) and (A1-b). Compound (A1-c) may be obtained from these compounds by dissolving both compounds in dimethylformamide, acetonitrile, an alcohol or the like, and selecting the temperature conditions from room temperature to reflux temperature. As an alternative method, (A1-a) may be reacted with sodium hydride in a solvent such as tetrahydrofuran or dimethylformamide and then reacted with (A1-b) at room temperature or while cooling on ice to obtain a salt free form of (A1-c), which may then be treated with any of various acids. Preferably, it is reacted with a 5 N hydrogen chloride or 5 N hydrogenbromide acetic acid solution in an organic solvent to yield (A1-c) as an ammonium salt.

[0053] Step 2 is a step of partial structural modification after Step 1 to yield compound (A1-c'). In this step, in cases where (A1-c) contains a *tert*-butyl group as the protecting group of carboxyl or a *tert*-butoxycarbonyl group as the protecting group of amino or amide hydrogen, deprotection is accomplished by reaction with 5 N hydrogen chloride in an organic solvent such as ethyl acetate or dioxane, using trifluoroacetic acid, if necessary diluting with dichloromethane, to yield (A1-c'). When (A1-c) contains an alkyl ester, heating to reflux may be accomplished in concentrated hydrochloric acid for hydrolysis to yield (A1-c') as a carboxylic acid. When (A1-c) contains tetrahydropyranyl, methoxymethyl or trialkylsilyl as a hydroxyl-protecting group, it may be deprotected by using 5 N hydrogen chloride in a water-containing organic solvent such as ethyl acetate and dioxane, trifluoroacetic acid or dilute hydrogen chloride in a solvent such as tetrahydrofuran and an alcohol, to yield (A1-c'). When (A1-c) contains benzyl as the protecting group for hydroxyl or carboxyl, or when it contains a double bond, the deprotecting reaction or conversion to a saturated compound may be accomplished by hydrogenation in a solvent such as ethyl acetate or an alcohol, in the presence of a metal catalyst'such as palladium hydroxide, to yield (A1-c'). When (A1-c) has carboxyl, it may be converted to an ester under acidic alcohol conditions or to an amide derivative under condensing conditions to yield (A1-c'). When (A1-c) has cyano, it may be converted to a carboxylic acid or carboxamide under hydrolyzing conditions to yield (A1-c').

(Scheme A-2)

[0054] This scheme is a method synthesizing compound (A1-c) from compounds (A2-a) and (A2-b). The compound represented by (A2-a) is one of the intermediates shown in Production Processes B to H, or a compound which can be easily converted from one of the intermediates.

[0055] In the formulas, Ar has the same definition as Ar in the compound represented by formula (I) in claim 1. X1,

X2, X3 and X4 have the same definitions as X1, X2, X3 and X4 in Scheme A-1.

[0056] Step 1 is a reaction for alkylation of the amino group and subsequent ring closure of the secondary amine produced thereby, in an one-pot synthesis. The both compounds are reacted in a dimethylformamide solvent from room temperature to 100°C. However, when the compound represented by (A2-b) is an amine salt, the reaction is conducted in the presence of 1,8-diazabicyclo[5.4.0]undec-7-ene.

(Scheme A-3)

[0057] This scheme is a method of protecting the imino group of compound (A1-c). In the formulas, Ar has the same definition as Ar in the compound represented by formula (I) in claim 1. $\text{X}_1, \text{X}_2, \text{X}_3, \text{X}_4$ and R_5 have the same definitions as $\text{X}_1, \text{X}_2, \text{X}_3, \text{X}_4$ and R_5 in Scheme A-1. R represents optionally substituted alkyl or alkenyl, and R_6 represents alkyl.

[0058] Step 1 is a reaction for introduction of a substituent at the imino group. An alkyl chlorocarbonate or a carbonate having nitrophenol as a leaving group (A3-a), is reacted therewith by reaction in a two-layer system using a base such as a 1 N aqueous sodium hydroxide solution or saturated bicarbonate water, in a solvent such as tetrahydrofuran, to yield (A3-b).

(Scheme A-4)

[0059] This scheme is a method of synthesizing a 2-halogeno-1-ethanone derivative represented by (A1-b) in Scheme A-1 from (A4-a), (A4-b) or (A4-c). In the formulas, Ar has the same definition as Ar in the compound represented by formula (I) in claim 1.

[0060] Step 1 is carried out by the following 3 methods corresponding to the starting compounds (A4-a), (A4-b) and (A4-c), respectively.

[0385] The following Production Processes PP to BOL are general production processes for aminophenol derivatives

using compounds synthesized by Production Process AP as the starting materials.

<Production Process PP>

[0386]

[0387] Production Process PP is a general synthesis method for a piperazine derivative.

[0388] Step 1 is a step of treating the amino group of compound (PP-a) with bischloroethylamine hydrochloride to form a piperazine ring. Preferably, compound (PP-a) is reacted with bischloroethylamine hydrochloride in 1,2-dichlorobenzene while heating to reflux, and the reaction is conducted while removing the generated hydrogen chloride gas to yield compound (PP-b).

[0389] In the formulas, R1 represents hydrogen, optionally substituted alkyl, optionally substituted cycloalkyl, optionally substituted alkoxy or optionally substituted alkylamino. R2 represents hydrogen or optionally substituted alkyl.

[0390] The formulas in Production Process PP show only a piperazine group, but any 5- to 8-membered ring containing more than one nitrogen atom may be formed, without any restriction to piperazine.

[0391] Step 2 is a step of introducing substituent R3 at the secondary amine position of the piperazine of compound (PP-b). Compound (PP-b) may be reacted with reagent R3-X1 (X1 = halogen) in an appropriate solvent such as dichloromethane or tetrahydrofuran, in the presence of an inorganic base such as potassium carbonate or sodium hydrogencarbonate or in the presence of an organic base such as trialkylamine or a pyridine derivative to yield compound (PP-c) having R3 introduced therein. R3 of reagent R3-X1 represents optionally substituted alkyl, optionally substituted alkyl having cyano on the end or a branch, alkyl having protected or substituted carboxylic acid on the end or a branch, alkyl having protected or substituted hydroxyl on the end or a branch, alkyl having protected or substituted amino on the end or a branch, optionally substituted sulfonyl, optionally substituted acyl, or optionally substituted carbamoyl. The reagent used to introduce substituent R3 into compound (PP-b) may be, instead of R3-X1 mentioned above, di-*t*-butyl dicarbonate or optionally substituted isocyanate. Compound (PP-b) may be subjected to reductive amination using an optionally substituted aldehyde or ketone and sodium triacetoxyborohydride or sodium cyanoborohydride for introduction of substituent R3.

[0392] Compound (PP-c) obtained by this Production Process is converted to the final target compound by Production Process A.

<Production Process MO>

[0393]

[0394] Production Process MO is a general production process for a heterocyclic amino derivative.

[0395] Step 1 is a step of treating the amino group of compound (MO-a) with a reagent represented by Z1-Y1-Y2-Y3-Z2 to form a nitrogen-containing ring.

[0396] Compound (MO-b) may be obtained by reacting compound (MO-a) with reagent Z1-Y1-Y2-Y3-Z2 in an ap-

propriate solvent such as dimethylformamide, tetrahydrofuran or dichloromethane, in the presence of an inorganic base such as potassium carbonate, sodium hydrogencarbonate or cesium carbonate or in the presence of an organic base such as trialkylamine or a pyridine derivative.

[0397] Z1 and Z2 in the reagent Z1-Y1-Y2-Y3-Z2 represent leaving groups such as halogen or sulfonate. Y1 and Y3 represent methylene optionally substituted with alkyl, alkoxy or the like, carbonyl, carboxyl, sulfonyl or amide. Elements to form the main chain at the portion represented by -Y2- include carbon, oxygen, nitrogen and sulfur. There are no particular restrictions on the length of the chain. An oxo group may also be present on the -Y2- main chain and form a carbonyl, sulfonyl or sulfinyl group together with carbon or sulfur on the main chain.

[0398] In the formulas, R1 has the same definition as R1 in Step 1 of Production Process PP. R6 represents an optionally substituted alkyl, a protecting group for hydroxyl, such as methoxymethyl, tetrahydropyranyl or trialkylsilyl, or alternatively alkyl having cyano at the end or a branch, alkyl having protected or substituted carboxylic acid on the end or a branch, arylalkyl having protected or substituted carboxylic acid on the end or a branch, alkyl having a protected or substituted hydroxyl group on the end or a branch, arylalkyl having protected or substituted hydroxyl on the end or a branch, alkyl having protected or substituted amino on the end or a branch, arylalkyl having protected or substituted amino on the end or a branch, optionally substituted sulfonyl, optionally substituted acyl or optionally substituted carbamoyl.

[0399] Step 2 is a step of deprotection when R6 of compound (MO-b) is a protecting group for the phenolic hydroxyl group. For example, compound (MO-c) wherein R6 is methoxymethyl may be obtained by treating compound (MO-b) with an acidic mixed solvent such as 5 N hydrochloric acid/acetone or 10% aqueous perchloric acid/tetrahydrofuran.

[0400] Step 3 is a step of introducing a new substituent R7 at the phenolic hydroxyl group of compound (MO-c).

[0401] R7 has the same definition as R6 in Step 1 of Production Process MO.

[0402] Compound (MO-d) wherein X2 of reagent R7-X2 described below is a leaving group such as halogen or sulfonate may be synthesized in the following manner. The compound (MO-d) may be obtained by reacting compound (MO-c) with reagent R7-X2 in an appropriate solvent such as dimethylformamide, acetonitrile, diethyl ether, tetrahydrofuran or dichloromethane, in the presence of an inorganic base such as potassium carbonate, sodium hydrogencarbonate or cesium carbonate or in the presence of an organic base such as trialkylamine or a pyridine derivative, or in the presence of sodium hydride.

[0403] Compound (MO-d) wherein R7 is methyl may be obtained at a high yield by reacting compound (MO-c) with diazomethane in diethyl ether or with trimethylsilyldiazomethane in acetonitrile-diisopropylethylamine-methanol.

[0404] Compound (MO-d) wherein X2 in reagent R7-X2 is hydroxyl may be obtained by reacting compound (MO-c) with reagent R7-X2 by the publicly known Mitsunobu reaction in an appropriate solvent such as tetrahydrofuran or toluene.

[0405] In Production Process MO, R6 and R7 may sometimes undergo conversion to a structure which is not defined herein by a method easily predictable by a person skilled in the art at an appropriate stage after introduction. Likewise, the -N-Y1-Y2-Y3(-N) portion obtained by cyclization in Step 1 may also undergo conversion to a structure which is not defined herein. (Conversion of the -N-Y1-Y2-Y3(-N) portion is described in some of the following Production Process examples).

[0406] Compounds (MO-b), (MO-c) and (MO-d) obtained in this Production Process are converted to the final target compounds by Production Process A.

<Production Process PR>

[0407] Production Process PR is a general synthesis method for pyrrolidine derivatives.

(Scheme PR-1)

[0408] Scheme PR-1 is one production process whereby the -N-Y1-Y2-Y3(-N) portion obtained by cyclization in Step 1 of Production Process MO may undergo additional structural conversion. In the formulas, R1 has the same definition as R1 in Step 1 of Production Process PP. R10 and R11 have the same definitions as R6 and R7 in Production Process MO. Although only methoxymethyl is mentioned as a protecting group for the phenolic hydroxyl groups of compounds (PR1-a) and (PR1-b), there is no limitation to methoxymethyl.

[0409] Step 1 is a step of introducing a substituent R10 at the hydroxyl group of compound (PR1-a). The reaction is conducted using reagent R10-X3 in an appropriate alkaline hydrous organic solvent, in the presence of a phase transfer catalyst. Preferably, compound (PR1-b) is obtained by reaction of reagent R10-X3 with compound (PR1-a) in a mixture of 50% aqueous sodium hydroxide and toluene in the presence of tetrabutylammonium bromide. Here, X3 is a leaving group such as a halogen or sulfonate.

[0410] Step 2 is a step of treating compound (PR1-b) in the same manner as Step 2 of Production Process MO to yield compound (PR1-c).

[0411] Step 3 is a step of introducing a new substituent R11 at the phenolic hydroxyl group of compound (PR1-c). Compound (PR1-c) may be treated in the same manner as for introduction of R7 in Step 3 of Production Process MO to yield compound (PR1-d) having R11 introduced therein.

[0412] Step 4 is a step of treating compound (PR1-a) in the same manner as Step 2 of Production Process MO to yield compound (PR1-e).

[0413] Step 5 is a step of selectively introducing substituent R11 only at the phenolic hydroxyl group of compound (PR1-e). Utilizing the difference in reactivity between the two hydroxyl groups of compound (PR1-e), treatment may be carried out in the same manner as for introduction of R7 in Step 3 of Production Process MO to yield compound (PR1-f) having R11 introduced therein.

[0417] Step 1 is a step of replacing the hydroxyl group of compound (PR1-a) with a substituent R14 (F or CN). When R14 is fluoro, compound (PR1-a) may be treated with diethylaminosulfur trifluoride (DAST) in dichloromethane to yield compound (PR2-a: R14 = F). When R14 is cyano, the hydroxyl group of compound (PR1-a) may first be converted to a leaving group with an acyl chloride reagent such as methanesulfonyl chloride in an appropriate solvent such as dichloromethane, in the presence of a base such as triethylamine. A hydrogen cyanide salt may then be reacted with this intermediate to introduce a cyano group. Preferably, the intermediate is added to dimethylformamide and reacted with sodium cyanide in the presence of tetrabutylammonium iodide to yield compound (PR2-a: R14 = CN).

[0418] Step 2 is a step of treating compound (PR2-a)(R14 = F or CN) in the same manner as Step 2 of Production Process MO to yield compound (PR2-b) (R14 = F or CN).

[0419] Step 3 is a step of introducing substituent R15 at the phenolic hydroxyl group of compound (PR2-b)(R14 = F or CN). Compound (PR2-b) may be treated in the same manner as for introduction of R7 in Step 3 of Production Process MO to yield compound (PR2-c)(R14 = F or CN) having R15 introduced therein.

[0420] Step 4 is a step of converting compound (PR2-c) wherein R14 = CN to compound (PR2-d) wherein the cyano group is converted to a carboxyl group by alkali hydrolysis. Preferably, compound (PR2-c) wherein R14 = CN may be reacted by heating to reflux in a mixed solvent of aqueous sodium hydroxide and ethanol to yield compound (PR2-d).

[0421] Step 5 is a step of esterifying or amidating the carboxylic acid group of compound (PR2-d) for introduction of a substituent R18 by common methods. The carboxylic acid group of compound (PR2-d) may be converted to an active species by a common method such as an acid mixing method using a chloroformic acid ester or an acid chloride method using oxalyl chloride, and then reacted with an alcohol or amine for conversion to (PR2-e). Alternatively, (PR2-d) may be esterified by reaction with the corresponding alkyl halide reagent in the presence of an appropriate base or by

reaction with di-*tert*-butyl dicarbonate in *tert*-butyl alcohol in the presence of dimethylaminopyridine. Compound (PR2-d) may also be subjected to dehydration reaction using an alcohol or amine and a peptide-forming condensing agent, for conversion to compound (PR2-e). The synthesis may also be carried out by other suitable known reactions. R18 represents amino or alkoxy.

[0422] Step 6 is a step of subjecting compound (PR2-a: R14 = CN) to alkali hydrolysis in the same manner as Step 4 followed by treatment in the same manner as the esterification in Step 5, and then ketal protection of the carbonyl group of the acetophenone. After converting compound (PR2-a: R14 = CN) to a carboxylic acid ester, it may be reacted with a ketalizing reagent such as methyl orthoformate under acidic conditions to yield compound (PR2-f). Preferably, the methyl orthoformate is reacted with the carbonyl group in methanol in the presence of an acid catalyst such as camphorsulfonic acid or *p*-toluenesulfonic acid and Molecular Sieve 3A, to yield compound (PR2-f).

[0423] Step 7 is a step of reducing the ester group of compound (PR2-f) for conversion to a hydroxymethyl group, and then selectively deprotecting only the ketal protection of the acetophenone carbonyl group. First, compound (PR2-f) is reacted with an ester-reducing reagent such as lithium aluminum hydride in an appropriate solvent such as tetrahydrofuran or diethyl ether, for conversion to a hydroxymethyl group. Next, under mildly acidic conditions, preferably under conditions with an acetic acid-tetrahydrofuran-water (4:1:1) mixed acid solvent, the ketal protecting group for the carbonyl group is selectively deprotected while leaving the methoxymethyl group for the phenolic hydroxyl, to yield compound (PR2-g).

[0424] Step 8 is a step of converting the hydroxyl group of compound (PR2-g) to substituent R19 (cyano or various alkoxy).

[0425] When R19 is cyano, treatment is carried out in the same manner as for conversion in Step 1 when R14 is cyano, to yield compound (PR2-h) wherein the hydroxymethyl group of compound (PR2-g) is converted to cyanomethyl, in which case R19 represents cyano. When R19 is an alkoxy group, compound (PR2-g) is treated in the same manner as Step 1 of Scheme PR-1 to yield compound (PR2-h) for conversion to the alkoxy group, in which case R19 has the same definition as OR10 in Scheme PR-1.

[0426] Step 9 is a step of deprotecting the methoxymethyl group serving as the protecting group for the phenolic hydroxyl of compound (PR2-h), and then introducing a substituent R20. First, compound (PR2-h) is treated in the same manner as Step 2 of Production Process MO to remove the methoxymethyl group. It is then treated in the same manner as for introduction of R7 in Step 3 of Production Process MO to yield compound (PR2-i) having R20 introduced therein.

[0427] Compounds (PR2-c), (PR2-e) and (PR2-i) obtained in this Scheme PR-2 are converted to the final target compounds by Production Process A.

[0445] Step 5 is a step of treating compound (PR5-e) with 1,2-bis(trimethylsiloxy)ethane and triethylsilyltriflate in dichloromethane to yield compound (PR5-f) wherein the acetyl carbonyl of compound (PR5-e) is ketal-protected.

[0446] Step 6 is a step of reducing the lactam carbonyl of compound (PR5-f) for conversion to methylene. Compound (PR5-f) may be reacted with tris(triphenylphosphine)rhodium(I) carbonyl hydride and diphenylsilane in an appropriate solvent such as tetrahydrofuran to yield compound (PR5-g).

<Production Process PS>

[0449]

[0450] This Production Process PS is a general synthesis method for a piperidine derivative. In the formulas, R₁ has the same definition as R₁ in Step 1 of Production Process PP. R₂₈ and R₃₀ have the same definitions as R₆ and R₇ in Production Process MO.

[0451] Step 1 is a step of reacting compound (PS-a) with formaldehyde to produce an imine, and then subjecting it to hetero Diels-Alder reaction with a diene having an enol ether structure to form an oxopiperidine ring. Preferably, Compound (PS-a) is reacted with 37% formalin in dichloromethane in the presence of magnesium sulfate to produce an imine, and the reaction mixture is filtered with celite. After adding 2-trimethylsilyloxy-1,3-butadiene and toluene to the filtrate and cooling to -70°C, a 1 M hexane solution of diethylaluminum chloride is added dropwise and the temperature is raised. After completion of the reaction, it is exchanged with a tetrahydrofuran solution and treatment is carried out with 1 N hydrochloric acid to yield compound (PS-b) having the silylenol ether converted to a ketone.

[0452] Step 2 is a step of treating compound (PS-b) with p-toluenesulfonylmethyl isocyanide (TosMIC) in dimethoxyethane-*tert*-butanol in the presence of *tert*-butoxypotassium, to yield compound (PS-c) having the oxo group converted to cyano.

[0453] Step 3 is a step of reacting the carbonyl group of compound (PS-b) with any of various organometallic reagents to yield a tertiary alcohol (PS-d) having an added substituent R₂₉. For example, compound (PS-b) may be reacted with methylmagnesium bromide in diethyl ether to yield compound (PS-d) having an added methyl group. R₂₉ represents alkyl, alkenyl or alkynyl.

[0454] Step 4 is a step of treating compound (PS-b) with a reducing agent for conversion to an alcohol compound

(PS-e). Any of various reducing agents may be used, but treatment with sodium borohydride in a methanol-dichloromethane mixed solvent is preferred to yield compound (PS-e).

[0455] Step 5 is a step of treating compound (PS-e) in the same manner as Step 1 of Scheme PR-1 of Production Process PR to yield compound (PS-f) having a newly introduced substituent R30 at the hydroxyl group. Substituent R30 has the same definition as R6 and R7 in Production Process MO.

[0456] Step 6 is a step of Horner-Emmons reaction at the carbonyl group of compound (PS-b) to yield the carbon-carbon bond formed unsaturated ester (PS-g). After treating a *tert*-butyl diethylphosphonoacetate with sodium hydride in 1,2-dimethoxyethane, compound (PS-b) dissolved in 1,2-dimethoxyethane is added to yield Compound (PS-g).

[0457] Step 7 is a step of 1,4-reduction of the unsaturated ester. Compound (PS-g) may be treated with sodium borohydride in a dichloromethane-methanol mixed solvent in the presence of a catalytic amount of nickel (II) chloride-6 hydrate, or reacted with magnesium in methanol for selective 1,4-reduction of the unsaturated ester to yield compound (PS-h).

[0458] A piperidine derivative may also be synthesized by the following Steps 8 to 10.

[0459] Step 8 is a step of treating compound (PS-i) in the same manner as Step 1 to yield compound (PS-j), with simultaneous formation of a oxopiperidine ring and deprotection of the methoxymethyl group serving as the phenolic hydroxyl-protecting group.

[0460] Step 9 is a step of treating compound (PS-j) in the same manner as for introduction of R7 in Step3 of Production Process MO, to yield compound (PS-k) substituted with substituent R28.

[0461] Step 10 is a step of selectively protecting the carbonyl group of the acetophenone of compound (PS-k). After adding compound (PS-k) to tetrahydrofuran, adding triethylamine and cooling to -70°C, the mixture is treated with *tert*-butyldimethylsilyl trifluoromethanesulfonate. The state of the reaction is periodically examined by thin-layer column chromatography, and the temperature is gradually raised if necessary. Water may be added at low temperature to stop the reaction to yield compound (PS-m).

[0462] Finally, Compound (PS-m) may be treated in the same manner as in Steps 2, 3 and 4. Alternatively, it may be converted directly to an acyl bromide according to Production Process A for conversion to the final target compound.

[0463] Compounds (PS-b), (PS-c), (PS-d), (PS-e), (PS-f), (PS-g), (PS-h), (PS-j) and (PS-k) obtained in this Production Process are converted to the final target compounds by Production Process A.

<Production Process AN>

[0464]

(Scheme AN-1)

[0465] This scheme is a general synthesis for an aniline derivative. In the formulas, R₁ has the same definition as in Step 1 of Production Process PP. R₃₁, R₃₂ and R₃₃ have the same definitions as R₆ and R₇ in Production Process MO.

[0466] Step 1 is a step of introducing one or two substituents R₃₁ at the amino group of compound (AN1-a). Compound (AN1-a) may be treated in approximately the same manner as for introduction of R₇ at the hydroxyl group in Step 3 of Production Process MO to yield compounds (AN1-b) and (AN1-c). When R₃₁ is bonded to the aniline amino group as simple alkyl and not via acyl or sulfonyl (for example, when R₃₁-I or R₃₁-Br is used as the reagent), a prolonged reaction with heating may be necessary to introduce the substituent R₃₁. Incidentally, compounds (AN1-b) and (AN1-c) may be easily separated and purified by silica gel column chromatography.

[0467] Step 2 is a step of treating compound (AN1-b) in the same manner as Step 1 to yield compound (AN1-d) having a newly introduced substituent R₃₂.

[0468] Step 3 is a step of treating compounds (AN1-c) and (AN1-d) in the same manner as Step 2 of Production

Process MO to yield the respective compounds (AN1-e) and (AN1-f).

[0469] Step 4 is a step of treating compounds (AN1-e) and (AN1-f) in the same manner as for introduction of R7 in Step 3 of Production Process MO to yield the respective compounds (AN1-g) and (AN1-h).

[0470] Step 5 is a step of using compound (AN1-i) as the starting material for treatment in the same manner as Step 1 to yield compound (AN1-j) having substituents R31 and R33. Compound (AN1-g) can also be obtained by this method.

[0471] Step 6 is a step of treating compound (AN1-j) in the same manner as Step 2 to yield compound (AN1-h).

[0472] Step 7 is a step of treating compound (AN1-i) in the same manner as the ketalizing step of Step 6 in Scheme PR-2, to yield compound (AN1-k).

[0473] Step 8 is a step of using an aldehyde or ketone (represented by R34-(C=O)-R35) and a reducing agent for reductive amination to yield compound (AN1-m).

[0474] Compound (AN1-k) may be reacted with sodium cyanoborohydride in a methanol-acetic acid mixed solvent or reacted with sodium triacetoxyborohydride in a 1,2-dichloroethane-acetic acid mixed solvent, to directly yield compound (AN1-m) having the ketal protecting group also deprotected. Either or both R34 and R35 may be hydrogen, or R34 and R35 may together form a ring.

[0475] Step 9 is a step of using an aldehyde or ketone (represented by R34-(C=O)-R35) and a reducing agent for reductive amination to yield compound (AN1-m), without ketal protection of compound (AN1-i). In most cases, reaction is conducted with sodium triacetoxyborohydride in a 1,2-dichloroethane-acetic acid mixed solvent.

[0476] Compounds (AN1-b), (AN1-c), (AN1-d), (AN1-e), (AN1-f), (AN1-g), (AN1-h), (AN1-j) and (AN1-m) obtained in this Scheme AN-1 are converted to the final target compounds by Production Process A.

Either or both R37 and R38 may form an amide bond with the aniline nitrogen, or the substituents may have ester structures. One of the substituents on the aniline nitrogen of the starting material (AN2-a) may be hydrogen.

[0478] Step 1 is a step of treating compound (AN2-a) in the same manner as the ketalizing reaction step of Step 6 in Scheme PR-2 of Production Process PR, to yield compound (AN2-b) having the carbonyl group protected.

[0479] Step 2 is a step of treating compound (AN2-b) with a reducing agent for conversion of an amide group to methyleneamino (from -N-CO- to -N-CH2-), or of an ester to an alcohol (from -CO-O- to -CH2-OH, from -O-CO- to -OH). Preferably, compound (AN2-b) may be treated with lithium aluminum hydride in diethyl ether to yield compound (AN2-c). Substituents R39 and R40 are defined as the structures after this conversion of R37 and R38.

[0480] Step 3 is a step of treating compound (AN2-c) in the same manner as the ketal deprotection step of Step 7 in Scheme PR-2, to yield compound (AN2-d).

[0481] Step 4 is a step carried out only when compound (AN2-d) has a hydroxyl group on substituent R39 or R40, and here a new substituent is introduced at the hydroxyl group to yield compound (AN2-e) by conversion to substituents R41 and R42.

[0482] The reaction of this step is conducted in the same manner as Step 1 in Scheme PR-1 of Production Process PR. Compounds (AN2-d) and (AN2-e) obtained in this Scheme (AN-2) are converted to the final target compounds by Production Process A.

Test Examples

[3358] The biochemical activities of compounds of the invention and salts thereof and their actions and effects as medicines (thrombin receptor binding capacity, platelet aggregation inhibitory action and smooth muscle cell proliferation inhibitory action) were evaluated by the following methods.

<Test Example 1>

[Receptor binding assay]

[3359] Blood was sampled from a healthy adult who had taken no drugs for one week, and 3.8% citric acid (a ratio of 1:9 with respect to the blood) was added as an anticoagulant. The mixture was then centrifuged at 100 g for 10 minutes at room temperature to yield platelet rich plasma (PRP). The platelet precipitate obtained by centrifuging the

PRP was homogenized with a Dounce homogenizer, and then centrifuged at 40,000 g for 60 minutes to yield platelet membrane. The platelet membrane was suspended in a solution prepared by adding DMSO (dimethyl sulfoxide) at 1% concentration to Buffer 1: a 50 mM Tris-HCl buffer containing 10 mM MgCl₂ and 1 mM EGTA (ethylene glycol tetraacetic acid), and the suspension was stored at -80°C. Bovine albumin and DMSO were added to Buffer 1 at 0.1% and 20%, respectively, to make preparation solutions for the test compound. The test compounds (20 µl) diluted at various concentrations with the preparation solutions were added to a 96-well multiscreen plate. Next, 80 µl of 25 nM [³H]Ala-(4-fluoro)Phe-Arg-(cyclohexyl)Ala-(homo)Arg-Tyr-NH₂ (high affinity TRAP) diluted with Buffer 1 was added and thoroughly mixed therewith. After then adding 100 µl of the previously prepared platelet membrane suspension (0.4 mg/ml) and mixing, incubation was performed at 37°C for 1 hour. The reaction mixture was suction filtered and then rinsed 3 times with 200 µl of Buffer 1. Next, 30 µl of liquid scintillator was added for measurement of the radioactivity of the plate using a Top Counter (Packard), the value of the radioactivity in the presence of the test compound minus non-specific binding portion was divided by the specific binding value (the value of the binding in the absence of the compound minus the non-specific binding portion) to determine the binding ratio, from which the IC₅₀ value was calculated. The non-specific binding was the value obtained with addition of 10 µM of high affinity TRAP. The results are shown in Tables 1 to 4.

<Test Example 2>

[Inhibitory effects on platelet aggregation using platelet rich plasma]

[3360] Blood was sampled from a healthy adult who had taken no drugs for one week, and 3.8% citric acid (a ratio of 1:9 with respect to the blood) was added as an anticoagulant. The mixture was then centrifuged at 100 g for 10 minutes at room temperature to yield platelet rich plasma (PRP). The PRP-removed blood was further centrifuged at 1000 g for 10 minutes to yield platelet poor plasma (PPP). The number of platelet was counted using a multi-parameter automatic hemocyte counter (K4500, Sysmex), and the PRP was diluted to approximately 300,000/µl with the PPP. The platelet aggregation activity was determined in the following manner using an Aggregometer (MC Medical). GPRP-NH₂ (final concentration 1 mM, 25 µl) was added as a fibrin polymerization inhibitor to the PRP (175 µl), after which Ca-free Tyrode solution (control) or the test compound suspension (25 µl) at different concentrations was added, incubation was performed at 37°C for 3 minutes and then 25 µl of thrombin at the minimum concentration required to produce maximum aggregation (final concentration: optimum concentration among 0.5-1.5 units/ml) was added, for initiation of platelet aggregation. PRP and Ca-free Tyrode solution (control) or the preparation solutions at various concentrations were pre-incubated at 37°C for 60 minutes, prior to the platelet aggregation reaction in some experiments. After addition of thrombin, the aggregation reaction was examined for 6 minutes and the areas under the aggregation curves were compared to determine the inhibition ratio, from which the IC₅₀ value was calculated. The results are shown in Tables 1 to 4.

<Test Example 3>

[Rat smooth muscle cell proliferation assay]

[3361] Vascular smooth muscle cells (rSMC) were isolated from male SD rat aorta by the explant method. DMEM medium (Sigma) containing 10% fetal bovine serum (GibcoBRL), streptomycin and penicillin was used as the proliferation medium, and subculture was carried out at 37°C in the presence of 5% CO₂. Culture was initiated after adding 100 µl of rSMC suspension in proliferation medium at a concentration of 1 x 10⁴ cells/ml, to a 96-well plate. After 3 days, cells were rinsed twice with 100 µl of DMEM medium, the medium was exchanged with 100 µl of DMEM medium containing 0.1% albumin (starvation medium), and serum starvation was initiated. The medium was exchanged two days after the serum starvation, 80 µl of starvation medium and 10 µl of the test compound diluted to different concentrations with the starvation medium were added, and then 10 µl of thrombin dissolved in the starvation medium (final concentration: 0.1 unit/ml) was added prior to further incubation for 2 days.

[3362] Upon adding 20 µl of MTT (3-[4,5-dimethylthiazol-2-yl]-2,5-diphenyltetrazolium bromide) dissolved in DPBS to 7.5 mg/ml, incubation was continued for 4 hours. The medium was removed by suction, 50 µl of a 10% SDS/0.029% ammonia solution was added, and the mixture was allowed to stand for 2 hours in a CO₂ incubator for complete lysis of the cells. As an index of cell proliferation, the OD 590 nm was measured using a plate reader (EL340, BIO-TEK Instruments Inc.), and the control OD value (OD value in the absence of the test compound) minus the OD value in the presence of the test compound was divided by the control OD value minus the blank OD value (OD value without thrombin stimulation) to determine the inhibition ratio, from which the IC₅₀ value was calculated. The results are shown in Tables 1 to 4.

[3363] The compounds of the present invention and salts thereof exhibited excellent thrombin receptor binding ca-

capacity in Test Example 1, and especially selective binding capacity with PAR1 thrombin receptor. In addition, the compounds of the invention and salts thereof exhibited excellent platelet aggregation inhibitory action in Test Example 2. The compounds of the invention and salts thereof also exhibited excellent smooth muscle cell proliferation inhibitory action in Test Example 3.

Industrial Applicability

[3364] The present invention provides novel 2-iminopyrrolidine derivatives represented by the formula (I) and salts thereof. The compounds of the invention represented by the formula (I) and salts thereof exhibit excellent thrombin receptor antagonism and especially selective antagonism for PAR1 thrombin receptors. The compounds of the invention and salts thereof can therefore inhibit cellular response to thrombin which includes platelet aggregation, without inhibiting the catalytic activity of thrombin which converts fibrinogen to fibrin, and can also inhibit vascular smooth muscle proliferation occurring as a result of damage to vascular walls by coronary angioplasty and the like, based on selective inhibition of PAR1.

[3365] Thus the compounds of the invention and salts thereof are useful as thrombin receptor antagonists (especially PAR1 thrombin receptor antagonists), platelet aggregation inhibitors (antithrombotic agents) and smooth muscle cell proliferation inhibitors, while also being useful as therapeutic or preventive agents for restenosis during or following angioplasty, unstable angina, stable angina, myocardial infarction, cerebral infarction, peripheral arterial occlusion and the like, as therapeutic or preventive agents for venous thromboses such as deep venous thrombosis, pulmonary embolism and cerebral embolism accompanying atrial fibrillation, glomerulonephritis and the like, as anti-inflammatory agents or as anti-restenosis agents.

This International Searching Authority found multiple inventions in this international application, as follows:

1. ☐ As all required additional search fees were timely paid by the applicant, this international search report covers all searchable claims.
2. ☐ As all searchable claims could be searched without effort justifying an additional fee, this Authority did not invite payment of any additional fee.
3. ☐ As only some of the required additional search fees were timely paid by the applicant, this international search report covers only those claims for which fees were paid, specifically claims Nos.:
4. ☐ No required additional search fees were timely paid by the applicant. Consequently, this international search report is restricted to the invention first mentioned in the claims; it is covered by claims Nos.:

Remark on Protest ☐ The additional search fees were accompanied by the applicant's protest.

☐ No protest accompanied the payment of additional search fees.
